TROVIS 5757-3 Electric Actuator with Process Controller

for domestic hot water heating

C € FR ENI

Electric actuator with process controller for local heat supply and district heating networks

Special features

The electric actuator with process controller is an electric actuator combined with an integrated digital controller used to position valves (DN 15 to 25). It is used to control domestic hot water heating in instantaneous heating systems used in small to medium-sized buildings connected to a district heating or local heat supply network. It is particularly suitable for mounting to SAMSON Types 3222, 3222 N and 2488 Valves as well as to special versions of Type 3226 and Type 3260 Valves.

- Control using two different set points, e.g. DHW temperature and DHW temperature for thermal disinfection. A binary input is used to switch between the set points.
- Function to maintain water temperature constant, preventing the heat exchanger from cooling down between tapping
- Direction of action reversible
 - Globe valve opens when the actuator stem retracts (increasing/increasing)
 - Three-way mixing valve mixes/diverts the flow(s) when the actuator stem extends (increasing/decreasing)
- Limit value monitoring:
 - The valve is closed by the actuator when the maximum adjustable limit is exceeded
 - The frost protection function is started when the temperature falls below the minimum adjustable limit
- Configuration, parameterization, diagnostic function and online connection for monitoring using the TROVIS-VIEW software
 - Direct data transmission using a connecting cable (direct connection to computer)
 - Data transmission over a memory pen
- No maintenance
- Special valve version available for small tapping amounts

Design and principle of operation

- Electric actuator with process controller
- 1.1 Connecting cable
- Handwhee
- Actuator stem
- Coupling nut
- 5 Travel indicator
- 6 7 Plug stem
- Valve spring
- Serial interface

Fig. 2: Valve and TROVIS 5757-3 Electric Actuator with Process Controller

The digital controller is connected to a temperature sensor on the input side which can be optionally upgraded by a flow rate sensor or a flow switch.

The set points W1 and W2 of the digital controller are set to 60 and 70 °C respectively and can be changed like all other settings using the TROVIS-VIEW software. The binary input can be used to change between the two set points W1 and W2.

The output signal of the digital controller functions as a threestep signal on the synchronous motor of the actuator and is transferred over the connected gear to the actuator stem (3 in Fig. 2) and used as the positioning force.

The motor is switched off by torque switches when an end position is reached or in case the motor is overloaded.

When the actuator stem extends, the valve is closed, opposing the force of the valve spring (7 in Fig. 2). When the actuator stem retracts, the valve is opened as the plug stem (6 in Fig. 2) follows the motion of the return spring.

Electrical equipment

Inputs

In addition to the temperature sensor input, the digital controller has a 0/4 to 20 mA current input. This can be used either instead of the temperature sensor or to connect an external reference variable.

The actuator requires a Pt1000 temperature sensor (e.g. Type 5207-0060) to be connected for it to function. The fast-response Pt1000 sensor allows the temperature to be controlled to the corresponding set point almost immediately.

The use of the Type 5207-0060 Pt1000 Sensor is recommended in conjunction with a sensor pocket to provide optimal positioning of the temperature sensor at the heat exchanger. The 0/4 to 20 mA current input can be used in place of the Pt1000 sensor for control purposes or as the reference variable.

In addition, a water flow sensor or a flow switch can be connected to quickly recognize when hot water is being tapped or to improve the control accuracy even further. Fig. 4 shows a sample application.

The switching output can be configured as either a pump output (circulation pump for the DHW circuit or heating circuit), a fault alarm output or an output to report when hot water is tapped.

Mounting

The electric actuator with process controller is mounted onto the valve using a coupling nut (4). Before mounting the actuator on the valve, retract the actuator stem. Hold the actuator stem in this position, while tightening the coupling nut with 20 Nm at the maximum.

Any mounting position may be used, however, the actuator may not be installed in a suspended position.

Any wires of the connecting cable that are not used need to be insulated.

Manual override

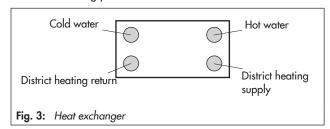

The valve can be moved to any position in the de-energized state by the handwheel (2 in Fig. 2). Travel and direction of action can be read off the travel indicator (5 in Fig. 2) on the side of the actuator housing.

Operation

Without circulation pipe

We recommend installing the heat exchanger in a horizontal position with the connections at the side to protect the hot water system against hot water accumulation when operated from standstill and to prevent limescale in the heat exchanger.

First consult the heat exchanger manufacturer concerning this mounting position and the intended effect.

Tapping small amounts of hot water

A special version of Type 3222/5757-3 (DN 25, K_{VS} = 2.5, with Type 3222 N K_{VS} = 2) with a special plug design is available for small installations (apartment or house). As a result, even small tapping amounts can be controlled optimally.

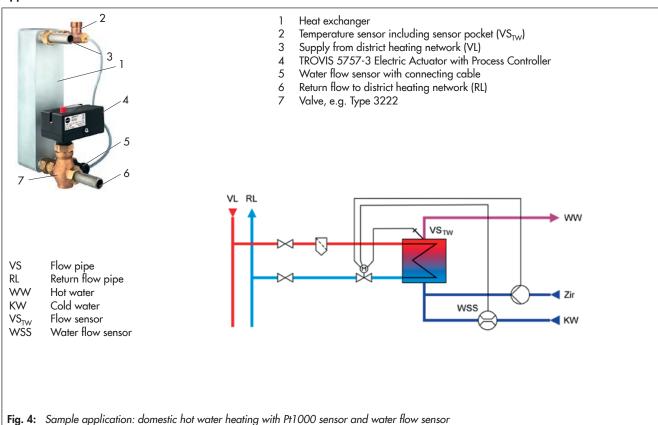

Digital controller settings

The digital controller settings can be changed in the TROVIS-VIEW software. $\label{eq:transfer} % \begin{subarray}{ll} \end{subarray} % \begin{$
