Series 280 · Type 3286 Steam Conditioning Valve Type 3286-1 and Type 3286-7 Pneumatic Steam Conditioning Valves ANSI version

Application

Final control element (angle valve) for process engineering applications and thermal plants

Nominal size	NPS 2 to 12
Pressure rating	Class 150 to 900
Temperatures	Up to 932 °F (500 °C)

Steam conditioners reduce the pressure and the temperature to the set points adjusted at the pressure controller and the temperature controller (Fig. 2). They consist of a Type 3286 Steam Conditioning Valve together with a Type 3271 Pneumatic Actuator (Type 3286-1 Steam Conditioning Valve) or with a Type 3277 Pneumatic Actuator (Type 3286-7 Steam Conditioning Valve).

The steam conditioning valve largely corresponds to a Type 3256 Angle Valve (► T 8066) fitted with a flow divider ST 3.

Special features

Valve body made of

- Cast steel
- High-temperature cast steel

Low-noise valve plug

- Metal seal
- High-performance metal seal
- Balanced to handle high differential pressures

Water supplied through the flow divider ST 3 ensures:

- Full utilization of the steam's kinetic energy to mix and split up the cooling water
- Fast evaporation independent of the steam flow rate
- Homogenous condition of the throttled and superheated steam
- Prevention of thermal shock or erosion caused by the cooling water entering the valve as the water does not have any contact with the valve body
- Low-vibration and low-noise operation

The steam conditioning valves with their modular design can be equipped with various accessories:

Positioners, limit switches, solenoid valves and other accessories according to IEC 60534-6-1 ¹⁾ and NAMUR recommendation. Refer to Information Sheet ► T 8350 for more details.

¹⁾ Accessories required. See associated actuator documentation.

Versions

Standard version with PTFE packing for temperatures up to 428 °F (220 °C) or with adjustable high-temperature packing up to 662 °F (350 °C), nominal size NPS 2 to 12, pressure rating Class 150 to 900

- **Type 3286-1** (Fig. 1) · Type 3286 Steam Conditioning Valve and Type 3271 Actuator with 350 to 2800 cm² actuator area (see Data Sheets ▶ T 8310-1, ▶ T 8310-2 and ▶ T 8310-3)
- **Type 3286-7** · Type 3286 Steam Conditioning Valve and Type 3277 Actuator with 350 to 750v2 cm² actuator area (see Data Sheet ▶ T 8310-1)

Further versions:

- Welding ends according to ASME B16.25
- **Insulating section** for temperatures up to 932 °F (500 °C)
- **Additional handwheel** · See Data Sheets ▶ T 8310-1, ▶ T 8310-2 and ▶ T 8310-3
- **DIN version** · DN 50 to 300, PN 16 to 160 · See Data Sheet ▶ T 8256
- **Perforated plug**

Principle of operation

The seat (4), plug with plug stem (5) and flow divider (62) are installed in the body (1). The plug stem is connected to the actuator stem (A7) by the stem connector clamps (A26/27) and is sealed by a spring-loaded V-ring packing (15). Alternatively, an adjustable high-temperature packing can be used.

The medium flows through the valve in the direction indicated by the arrow. The plug position determines the cross-sectional area between the seat and plug.

The cooling water is fed to the flow divider (62) through the connecting pipe on the bonnet (2) and holes in the clamping element (63). After flowing through the cross-sectional area between seat and plug, the steam flow reaches its maximum velocity and comes into contact with the cooling water at the inner wall of the flow divider. The steam flow and the entrained water are mixed in the narrow wire mesh of the flow divider. At the same time, the steam velocity is reduced, releasing some of its heat to the water across the large surface of the wire mesh coil, which causes it to evaporate quickly. The steam/water mixture leaves the flow divider as a fine mist with a high steam content. Evaporation is completed a short distance downstream of the steam conditioning valve. The water atomization described is ensured over the whole load range since the steam velocity at the throttling point is independent of the flow rate.

Fail-safe position

Depending on how the springs are arranged in the pneumatic actuator, the valve has two different fail-safe positions that become effective when the supply air fails or when the air supply pressure drops.

- **Actuator stem extends (fail-close):** the valve closes when the supply air fails.
- **Actuator stem retracts (fail-open):** the valve opens when the supply air fails.

Differential pressures

The permissible differential pressures can be found in the Information Sheet ▶ T 8000-4.

Note: Fig. 3 to Fig. 4 show configuration examples.

¹⁾ Version with balanced plug: seat bore 125 is only possible for Class 600 and 900. A special machined plug and seat bore 150 (special version) are required for Class 150 and 300.

Selection and sizing of the steam conditioning valve

The steam conditioning valves require particularly careful sizing. Therefore, SAMSON performs the final sizing of the valves.

1. Calculate the suitable C_v coefficient according to IEC 60534
2. Select nominal size and C_v coefficient from Table 3.
3. Select materials, pressure and temperature from Table 1 and Table 2 and from the pressure-temperature diagram (► T 8000-2).
4. Select accessories from Table 1 and Table 2.
5. Check the installation conditions as described in TV-SK 9778-1.
6. Check the limits of application (more details on request).
